

Lakes, Ponds, and Temporary Pools (Exploring Ecosystems)

Lakes, ponds, and temporary pools have always played an important role in human civilization. People, like all living things, need water to survive. While most of Earth is covered with water, only a small portion of that is freshwater--the kind of water we need to drink and to water our crops. From small, humanmade farm ponds to the largest lakes, bodies of standing water are an important source of freshwater. In addition, many lakes and ponds provide us with an important food source--fish. These bodies of water also provide food for many other animals, including the birds, muskrats, and beavers that live along their shores. Temporary pools serve an nurseries for many different animals, including frogs and salamanders. In this book, author and teacher David Josephs presents more than 20 projects and investigations designed to help young scientists explore and understand lakes, ponds and temporary pools. The activities will help readers learn about the plants, animals, and microorganisms that inhabit bodies of freshwater. They also emphasize field observations and provide instructions for measuring the physical characteristics of lakes, ponds, and temporary pools. The book even contains detailed instructions for making much of the equipment readers will need to undertake these explorations. By going out and getting muddy, readers will come to appreciate the importance of Earths freshwater habitats and the diversity of life they contain.
